

WHAT IS APPSHEET NOT GOOD AT?

COMPLEX LOGIC & COMPLEX WORKFLOWS

Good for simple logic and processes.
No custom scripting or intricate logic.

PERFORMANCE ISSUES

Very large datasets (millions of rows) can suffer performance issues unless well designed to make use of AppSheet scalability features

LIMITED UI CUSTOMIZATION

Branding is possible
logo
dark & light theme
colors

Some UI customization, i.e.
menu location
navigation location
top and bottom bar buttons

Stuck with the given types of view
table
card
deck etc

You cannot add new features

LIMITED SCALABILITY

Ideal for small to mid-size apps
Thousands or millions of users may be better served by a custom app

GOOGLE INTEGRATION

Works well with Google Workspace and some other services.
Not as broadly integrated as other systems like Zapier

PRICING

Per-User licencing
There comes a point where user costs over time would outweigh custom development and server costs

OFFLINE FUNCTIONALITY

Apps are designed to work offline, but may not be as reliable as a fully custom coded offline solution.
